Hitachi Node-RED Team

- ❑ For large flow, we sometimes want to develop it by several developers.
 - ❑ Current Node-RED provides a feature for smartly merging conflicting flows, but sometimes fails.
- Need a way to restrict editable region for each developer

❑ Proposal:

- Make each tab can have single Node-RED client that can edit it.
- Other editors treat the tab read only.

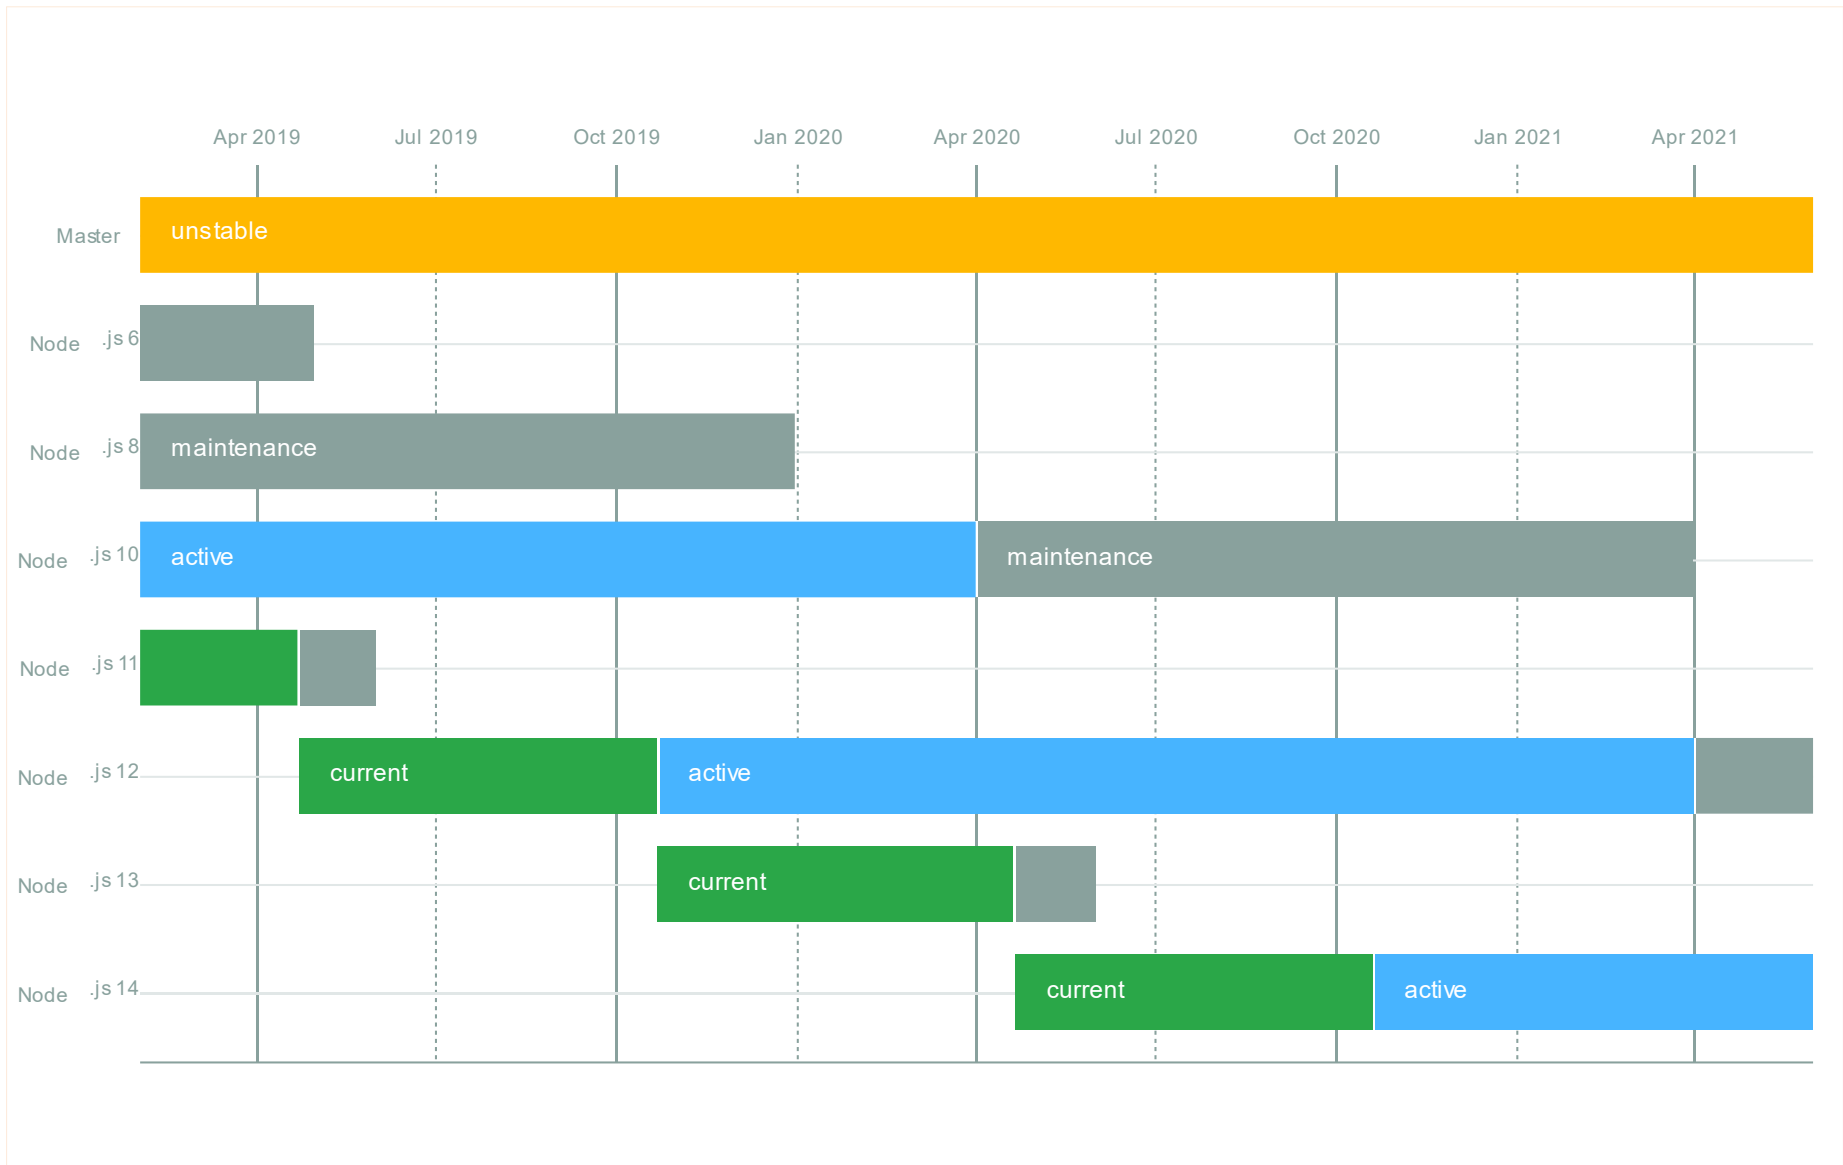

- ❑ Many OSSs define LTS policy for maintenance lifecycle management
- ❑ Since milestone release Node-RED 1.0 was released, we would like to know possibility of incorporating this to Node-RED

❑ Example of LST policy

#	Name	LTS period	Notes
1	Node.js	18 months	active LTS for every two major release
2	Linux Kernel	6~10+ years	depends on projects
3	OpenJDK	6 months	
4	Firefox	1 year	
5	Ubuntu	5 years	released every 2 years
6	Windows 10	10 years	

LTS Example: Node.js
