# Integrate WoT Discovery into Node-RED

- Some WoT WG participants are interested in Node-RED integration to build IoT applications using Thing with Node-RED, especially combining discovery function.
- In the last event, I demonstrated a Node-RED integration using palette manager function to search Things in local area network.

- To fully utilize WoT discovery function, it is necessary to extend a search function in palette manager (e.g. semantic search using SPARQL, etc.) using the Plug-in mechanism for Node-RED, or to extend flow-library server.
- I'd like to release these features as a part of Node-RED project if possible. What approach do you think is appropriate?
